

SUMMARY OF PRODUCT CHARACTERISTICS

1. NAME OF THE VETERINARY MEDICINAL PRODUCT

Tessie 0.3 mg/ml oral solution for dogs

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each ml contains:

Active substance:

0.3 mg tasipimidine equivalent to 0.427 mg tasipimidine sulfate

Excipients:

Qualitative composition of excipients and other constituents	Quantitative composition if that information is essential for proper administration of the veterinary medicinal product
Sodium benzoate (E211)	0.5 mg
Tartrazine (E102)	
Brilliant blue (E133)	
Sodium citrate	
Citric acid monohydrate	
Purified water	

Clear green solution.

3. CLINICAL INFORMATION

3.1 Target species

Dogs

3.2 Indications for use for each target species

Short term alleviation of situational anxiety and fear in dogs triggered by noise or owner departure.

3.3 Contraindications

Do not use in cases of hypersensitivity to the active substance or to any of the excipients.

Do not use in dogs with moderate or severe systemic disease (graded as ASA III or greater), e.g. moderate to severe renal, liver or cardiovascular disease.

Do not use in dogs obviously sedated (shows signs of e.g. drowsiness, uncoordinated movements, decreased responsiveness) from previous dosing.

3.4 Special warnings

Typical signs of anxiety and fear are panting, trembling, pacing (frequent change of place, running around, restlessness), seeking people (clinging, hiding behind, pawing, following), hiding (under furniture, in dark rooms), trying to escape, freezing (absence of movements), refusing to eat food or treats, inappropriate urination, inappropriate defecation, salivation, etc. These signs may be alleviated but may not be completely eliminated.

In extremely nervous, excited or agitated animals, the levels of endogenous catecholamines are often high. The pharmacological effect induced by alpha-2 agonists in such animals may be reduced.

Consideration should be given to use of a behavioural modification programme, especially when dealing with a chronic condition such as separation anxiety.

3.5 Special precautions for use

Special precautions for safe use in the target species:

If the dog is sedated (shows signs of e.g. drowsiness, uncoordinated movements, decreased responsiveness), do not leave the dog alone and withhold food and water.

The safety of administering tasipimidine to dogs younger than 6 months and older than 14 years of age or weighing less than 3 kg has not been studied. Use only according to a benefit-risk assessment by the responsible veterinarian.

The accuracy of the syringe is demonstrated only for doses of 0.2 ml and higher. Dogs requiring doses lower than 0.2 ml can therefore not be treated.

As a decrease of body temperature can occur after the administration, the treated animal should be kept at a suitable ambient temperature.

Tasipimidine may indirectly induce an increase of glycaemia. In diabetic animals, use according to a benefit-risk assessment by the veterinarian.

In case of vomiting after intake of the oral solution, maintain the usual recommended interval between two administrations (at least 3 hours) before administering the product again.

Special precautions to be taken by the person administering the veterinary medicinal product to animals

Exposure to tasipimidine may cause adverse effects such as sedation, respiratory depression, bradycardia and hypotension.

Avoid oral ingestion and skin contact including hand-to-mouth contact.

In order to prevent children from getting access to the product, don't leave the filled dosing syringe unattended while preparing the dog for administration. The used

syringe and the closed bottle should be returned to the original carton and stored out of the sight and reach of children.

In case of accidental spillage onto skin, wash the exposed skin immediately with water and remove contaminated clothes. In case of accidental ingestion, seek medical advice immediately and show the package leaflet or the label to the physician. Do not drive, as sedation and changes in blood pressure may occur.

This product may cause slight eye irritation. Avoid eye contact including hand-to-eye contact. In case of eye contact, rinse the eyes immediately with water.

This veterinary medicinal product may cause hypersensitivity (allergy). People with known hypersensitivity to tasipimidine or any of the excipients should avoid contact with the veterinary medicinal product.

Wash hands after use.

Special precautions for the protection of the environment:

Not applicable.

3.6 Adverse events

Dogs:

Very common (> 1 animal / 10 animals treated):	Emesis Lethargy
Common (1 to 10 animals / 100 animals treated):	Behavioural disorder (Barking, Avoidance, Increased reactivity) Diarrhoea, Gastroenteritis, Nausea Hypersensitivity reaction Leucopenia Ataxia, Sedation, Somnolence, Disorientation Urinary incontinence Anorexia, Pale mucous membranes, Polydipsia
Undetermined frequency (cannot be estimated for the available data):	Decreased heart rate ¹ , Low blood pressure ¹ Decreased body temperature ¹

¹observed in non-anxious animals

Reporting adverse events is important. It allows continuous safety monitoring of a veterinary medicinal product. Reports should be sent, preferably via a veterinarian, to either the marketing authorisation holder or its local representative or the national

competent authority via the national reporting system. See the package leaflet for respective contact details.

3.7 Use during pregnancy, lactation or lay

Laboratory studies in rats have shown evidence of developmental toxicity at maternotoxic doses causing clear sedation-related clinical signs, decreased food consumption, and decreased body weight gain of the dam.

The safety of the veterinary medicinal product has not been established during pregnancy and lactation in the target species.

Do not use during pregnancy and lactation.

3.8 Interaction with other medicinal products and other forms of interaction

The use of other central nervous system depressants is expected to potentiate the effects of tasipimidine and therefore an appropriate dose adjustment should be made.

Tasipimidine has been studied in combination with clomipramine, fluoxetine, dexmedetomidine, methadone, propofol and isoflurane.

In studies on laboratory dogs receiving a combination of fluoxetine (1.1–1.6 mg/kg daily administration for 12 days) and tasipimidine (20 mcg/kg once, at day 12, N = 4 dogs) or tasipimidine (20 mcg/kg) and clomipramine (1.2–2.0 mg/kg) both administered twice daily during 4 days to 6 dogs, no clinical interactions have been observed. When tasipimidine is used concomitantly with clomipramine or fluoxetine, tasipimidine dose should be reduced to 20 mcg/kg bodyweight. Should the dog have earlier required a dose reduction of tasipimidine to 20 mcg/kg, this dose may be maintained. However, a test dose should be given according to the instructions in section 3.9 when starting the combination use. Lower doses of tasipimidine have not been studied in combination use.

Tasipimidine induced mild to moderate cardiovascular depression when given alone or in combination with methadone or methadone and dexmedetomidine in healthy dogs. If a dog treated with tasipimidine requires general anaesthesia, the required propofol induction dose and isoflurane concentration will need to be reduced.

3.9 Administration routes and dosage

Oral use.

The product is intended for short term use but it can be safely administered for up to 9 consecutive days.

The product should be administered orally at a dose of 0.1 ml/kg bodyweight (equivalent to 30 mcg/kg) in situational anxiety and fear in dogs triggered by noise or owner departure.

If the product is intended for use in situations where the dog is meant to be alone following the administration, a test dose should be given. Following administration of the test dose the dog should be observed for 2 hours to make sure the selected dose of the product is not associated with adverse reactions and that it is safe for the treated dog to be left alone (see section 3.5).

Do not feed the dog for one hour before to one hour after treatment as absorption may be delayed. A small treat can be given to ensure that the dog swallows the solution. Water can be freely available.

Observe the dog. If the fear triggering event continues and the dog starts to show signs of anxiety and fear again, re-dosing can be done when at least 3 hours has passed from the previous dose. The product can be dosed up to 3 times within every 24 hours.

Dose reduction

If the dog appears drowsy, its movements are uncoordinated or it responds to its owner's call abnormally slowly after receiving treatment, the dose could be too high. The subsequent dose should be reduced to 2/3 of the volume of the previous dose, corresponding to 20 mcg/kg bodyweight. Dose reduction should be implemented following veterinary advice only. When used concomitantly with clomipramine or fluoxetine, tasipimidine dose should be reduced to 20 mcg/kg bodyweight (see section 3.8).

Anxiety and fear triggered by noise:

The first dose should be given one hour before expected start of an anxiety triggering stimulus, as soon as the dog shows the first signs of anxiety, or when the owner detects a typical stimulus for eliciting anxiety or fear in the respective dog.

Anxiety and fear triggered by owner departure:

The dose should be given one hour before expected owner departure.

Instructions for administration:

1. REMOVE CAP

Remove the cap from the bottle (press down and twist). Save the cap for reclosure.

2. CONNECT SYRINGE

Push the syringe tightly into the adapter located at the top of the bottle. Use only the syringe provided with the product.

3. SELECT DOSE

Turn the bottle with the syringe in place upside down. Pull the plunger out until the black line of correct dose (ml) can be seen under the grip plate of the syringe barrel.

If the dog weighs more than 30 kg, the total dose will be given in two separate doses as the syringe holds maximally 3.0 ml of solution.

The accuracy of the syringe is demonstrated only for doses of 0.2 ml and higher. Dogs requiring doses lower than 0.2 ml can therefore not be treated.

Don't leave the filled dosing syringe unattended while preparing the dog for administration.

4. GIVE DOSE

Gently place the syringe in the mouth of the dog and administer the dose to the base of the tongue by gradually pressing the plunger until the syringe is empty. Give the dog a small treat to ensure that the dog swallows the solution.

5. BACK TO PACKAGE

Replace the cap and rinse the syringe with water when finished. Put the syringe and bottle back to the secondary package and put them in the refrigerator.

3.10 Symptoms of overdose (and where applicable, emergency procedures and antidotes)

The level and duration of sedation is dose dependent, and signs of sedation may therefore particularly occur in case the dose is exceeded. Dogs receiving a high overdose of the product have a higher risk of aspirating vomit due to the emetic and CNS depressant effects associated with the active substance. A very high overdose can potentially be life-threatening.

Reduced heart rate may be seen after administration of higher than recommended doses of tasipimidine oral solution. Blood pressure decreases slightly below normal levels. Respiration rate can occasionally decrease. Higher than recommended doses of tasipimidine oral solution may also induce a number of other alpha-2 adrenoceptor mediated effects, which include increase in blood pressure, decrease in body temperature, lethargy, vomiting and a QT prolongation.

As demonstrated in a preclinical study, the effects of tasipimidine can be reversed using a specific antidote, atipamezole (alpha-2 adrenoceptor antagonist). One hour after treatment with tasipimidine at 60 mcg/kg body weight, an atipamezole dose of 300 mcg/kg bodyweight, corresponding to 0.06 ml/kg bodyweight of solution containing 5 mg/ml, was administered intravenously. Results of this study demonstrated that the effects of tasipimidine could be reversed. However, as the half-life of tasipimidine exceeds that of atipamezole, some signs of tasipimidine effects may reappear.

3.11 Special restrictions for use and special conditions for use, including restrictions on the use of antimicrobial and antiparasitic veterinary medicinal products in order to limit the risk of development of resistance

Not applicable.

3.12 Withdrawal periods

Not applicable

4. PHARMACOLOGICAL INFORMATION

4.1 ATCvet code: QN05CM96

4.2 Pharmacodynamics

The veterinary medicinal product contains tasipimidine as the active substance. Tasipimidine is a potent and selective alpha-2A adrenoceptor agonist (as demonstrated in human adrenoceptors) that inhibits the release of noradrenaline from noradrenergic neurons, blocks the startle reflex and thus counteracts arousal.

Tasipimidine as an alpha-2 adrenoceptor agonist reduces the over activation of noradrenergic neurotransmission (increased release of noradrenaline in the *locus coeruleus*), which is shown to induce anxiety and fear in experimental animals exposed to stressful situations.

In summary, tasipimidine exerts its effects by decreasing central noradrenergic neurotransmission. In addition to the anxiolytic effect, tasipimidine can cause other known dose dependent alpha-2 adrenoceptor-mediated pharmacological effects such as sedation, analgesia and lowering of heart rate, blood pressure and rectal temperature.

The onset of effect is usually seen within 1 hour after treatment administration. The duration of effect shows some individual variation, and it can last for up to 3 hours or longer.

4.3 Pharmacokinetics

Absorption

After oral administration in solution, tasipimidine is rapidly absorbed in fasted dogs. In a pharmacokinetic study in fasted dogs, a moderate oral bioavailability of tasipimidine was observed being on average 60 %. After oral administration of 30 mcg/kg to dogs in fasted state, the maximum plasma concentration of tasipimidine is approximately 5 ng/ml and occurs at 0.5–1.5 hours. When the dosing is repeated 3 hours later, the following maximum plasma concentration is shown to be moderately (30 %) higher but there is no effect on the time of maximum concentration. Feeding at the time of dosing slows down the absorption and decreases the maximum plasma levels. In fed state the peak concentration is lower being 2.6 ng/ml and comes later at 0.7–6 hours. The total plasma exposure to tasipimidine is comparable in fasted and fed states. Systemic exposure increases approximately in a dose proportional manner within the dose range of 10–100 mcg/kg. No signs of accumulation are seen after repeated administration.

Distribution

Tasipimidine is a highly distributed compound, the volume of distribution in dogs is 3 l/kg. Tasipimidine penetrates the brain tissue in dogs and the drug concentration after repeated administration is higher in brain than in plasma. The in vitro binding of tasipimidine to dog plasma proteins is low, approximately 17 %.

Metabolism

The metabolism of tasipimidine occurs mainly through demethylation and dehydrogenation and the most abundant circulating metabolites are demethylation and dehydrogenation products. The demethylated dehydrogenation product of tasipimidine is found in trace levels in dog plasma after high doses. The circulating

metabolites are much less potent than the parent drug, as demonstrated in human and rat adrenoceptors.

Excretion

Tasipimidine is a highly cleared compound being rapidly eliminated from the circulation of dogs. The total clearance is 21 ml/min/kg after 10 mcg/kg intravenous bolus dose. The mean terminal half-life is 1.7 hours after oral administration in fasted state. The portion of tasipimidine excreted unchanged in urine is 25 %. All the circulating metabolites are excreted in urine much less compared to tasipimidine.

5. PHARMACEUTICAL PARTICULARS

5.1 Major incompatibilities

In the absence of compatibility studies, this veterinary medicinal product must not be mixed with other veterinary medicinal products.

5.2 Shelf life

Shelf life of the veterinary medicinal product as packaged for sale: 3 years.
Shelf life after first opening the immediate packaging: 1 year in a refrigerator (2°C – 8°C) or 1 month below 25°C.

5.3 Special precautions for storage

Store in a refrigerator (2°C – 8°C). Keep the bottle in the outer carton in order to protect from light.

5.4 Nature and composition of immediate packaging

15 ml clear glass type III bottle with a polypropylene child-resistant closure and a low-density polyethylene adapter and a high-density polyethylene liner. An oral low-density polyethylene/polystyrene syringe is included in the pack.

Pack sizes:

Cardboard box with 1 bottle and an oral syringe.

5.5 Special precautions for the disposal of unused veterinary medicinal product or waste materials derived from the use of such products

Medicines should not be disposed of via wastewater.

Use take-back schemes for the disposal of any unused veterinary medicinal product or waste materials derived thereof in accordance with local requirements and with any national collection systems applicable to the veterinary medicinal product concerned.

6. NAME OF THE MARKETING AUTHORISATION HOLDER

Orion Corporation

7. MARKETING AUTHORISATION NUMBER

Vm 06043/5004

8. DATE OF FIRST AUTHORISATION

16 August 2021

9. DATE OF THE LAST REVISION OF THE SUMMARY OF THE PRODUCT CHARACTERISTICS

September 2025

10. CLASSIFICATION OF VETERINARY MEDICINAL PRODUCT

Veterinary medicinal product subject to prescription.
